Workplace Incident Analysis Report

Prepared by: **Amelie Caroline Mbende Medjane**

Date: May 5th, 2026

This report analyzes workplace safety incidents across different plants, departments, and time periods. The goal is to identify patterns in incidents, understand their impact, and highlight areas where safety improvements can be made.

Use the filters to explore the data over time.

Most high-cost incidents originate from lost-time cases within operational departments such as Shipment, Maintenance, Fabrication.

Certain incident types occur frequently but generate relatively low operational costs, while less frequent incidents contribute disproportionately to financial and productivity losses.

“Vehicle incidents show relatively low frequency but high operational impact due to increased lost workdays and costs.”

Vehicle-related incidents show lower occurrence frequency but significantly higher incident costs and lost workdays compared to other categories.”

Burn and cut incidents represent the highest operational burden due to their combination of frequency and lost workdays.

Most high-cost incidents originate from lost-time cases within operational departments such as Shipment, Maintenance, Fabrication.

Certain incident types occur frequently but generate relatively low operational costs, while less frequent incidents contribute disproportionately to financial and productivity losses.

Vehicle-related incidents show lower occurrence frequency but significantly higher incident costs and lost workdays compared to other categories.

Near misses occur more frequently during afternoon shifts, indicating potential operational fatigue or workflow congestion.

Burn and cut incidents represent the highest operational burden due to their combination of frequency and lost workdays.
